

# CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2001  
DateRun: 01/02/2001  
Experimenters: Jason Marshall  
ClientType: University  
ProjectNumber: Project #1  
Substrates: Alloys, Aluminum  
PartType: Coupon  
Contaminants: Paints, Resins/Rosins  
Cleaning Methods: Immersion/Soak  
Analytical Methods:  
Purpose: Information request

Experimental Procedure: SUBSTRATE MATERIAL: Aluminum turbines  
QUESTION ASKED: We are working with a firm which remanufactures turbine engines. The aluminum alloy intakes of the engines are coated with a very tough epoxy paint. The current material used to remove the epoxy is Turco Transpo, manufactured by Turco Products, Inc. While very effective, this chemical is extremely hazardous. It is composed of approximately 10% cresol, 55%, dichloromethane, <1% Sodium chromate, and 5% sodium phenolate. Does anyone know of a safer, less hazardous alternative? Media blasting is, unfortunately, not an alternative in this application.

Results: RESPONSE/ANSWER: Using the lab's Simple Solutions and ICS:DOV databases, the following two lists were generated based on the supplied information:
