

CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2010
DateRun: 06/21/2010
Experimenters: Jason Marshall, Timothy Weil
ClientType: Cleaner Manufacturer
ProjectNumber: Project #1
Substrates: Ceramics, Plastic
PartType: Coupon
Contaminants: Greases, Oil, Hucker's Soil, Food
Cleaning Methods: Manual Wipe
Analytical Methods: Gravimetric

Purpose: To evaluate the supplied solvents for all purpose cleaning.

Experimental Procedure: The two supplied solvent were used at full strength and at a 50:50 mix with each other. Solvents were compared with Dowanol DPM - dipropylene glycol methyl ether.

Prewriteed ceramic, plastic G-10 and painted steel coupons were coated with Hucker's Soil Formulation (Jiffy Creamy Peanut Butter 9.2%, Salted Butter 9.2%, Arrowhead Mills stone ground wheat flour 9.2%, Egg Yolk 9.2%, Evaporated milk 13.8%, Distilled water 45.8%, Printer's ink with boiled linseed oil 0.9%, Shaws saline solution 2.7%) using a handheld swab and allowed to dry for 24 hours at room temperature. The contaminated coupons were weighed again to determine the amount of soil added.

Three coupons were placed into a Gardner Straight Line Washability unit. A Kimberly-Clark Wypal reinforced paper towel was attached to the cleaning sled and soaked with 5-7 sprays of cleaning solutions. Each coupon was sprayed 7-10 times with the same cleaning solution. The cleaning unit was run for 20 cycles (~33 seconds).

At the end of the cleaning, coupons were wiped once with a dry paper towel. Final weights were recorded, efficiencies were calculated and recorded. A second soil consisting of DCC 17 soil (Mix lard, vegetable oil, vegetable shortening and carbon black) was applied to the same coupon types and cleaned in the same manner as the Hucker's soil.

Results: During cleaning trials, the ceramic coupons were noted that the weights being recorded did not match the visual observations. Some of the calculated efficiencies were in excess of 100% when the coupons were still visible dirty. Likewise, some coupons that had more than half the soil removed resulted in less than 50% calculated efficiency. The plastic coupons showed more consistent results. The table lists the amount of soil added, the amount removed and the cleaning efficiency for each coupon cleaned.

Cleaner	Initial wt	Final wt	% Removed

Summary

	Overall average	Plastic	without Ceramic-huckers	DCC Grease	Hucker's
SG21000D	65.77	59.57	62.80	70.68	60.87
SG22002D	77.53	78.09	78.98	75.20	79.86

CLEANING LABORATORY EVALUATION SUMMARY

50/50	89.31	85.96	85.46	86.94	91.67
DBM	125.08	87.39	80.29	76.67	173.49

Summary:

Substrates:		Ceramics, Plastic			
Contaminants:		Greases, Oil, Hucker's Soil, Food			
Company Name:	Product Name:	Conc.:	Efficiency:	Effective:	Observations:
Segetis	Segetis SG21000D	100	72.10	<input type="checkbox"/>	
Segetis	Segetis SG22002D	100	69.64	<input type="checkbox"/>	
Dow Chemical Company	Dowanol DPM	100	87.26	<input checked="" type="checkbox"/>	
Segetis	Segetis SG21000D	50	89.42	<input checked="" type="checkbox"/>	Mix with Segetis SG22000D 50:50

Conclusion:

With some inconsistent calculated efficiencies with ceramic coupons, a follow test will be conducted on porcelain coupons and stainless-steel coupons. The supplied solvents did have positive results for potential all-purpose cleaning solvents. The average removal for both soils from the plastic surface was 85% for the 50:50 mix which was about the same as the DBM comparison solvent. Typically, the 85% level is considered to be effective for the TURI Lab testing methodology.
