SCL #: 2008

DateRun: 05/21/2008

Experimenters: Jason Marshall, Shweta Bansal

ClientType: Machining Company

ProjectNumber: Project #1

Substrates: Aluminum

PartType: Coupon

Contaminants: Cutting/Tapping Fluids

Cleaning Methods: Mechanical Agitation

Analytical Methods: Gravimetric

Purpose: To evaluate products at higher concentrations and longer times on grinding fluid.

Experimental Procedure: Three products from previous lab testing were used at 20% dilution and one was used at five percent. Prewedged coupons were coated with the supplied grinding fluid (Houghton - Grind (Houc 420060)) using a hand held swab and weighed a second time to determine the amount of soil added.

Each cleaner was put in a bowl and three coupons were dunked into the solution at a constant rate for 30 seconds of cleaning. The coupons were then put on a tray and when done and allowed to air dry. There was no rinse. The process was done to as closely replicate the process used on site as possible. Once dry, final weights were recorded, and efficiency calculated for each coupon cleaned.

A second batch of coupons were cleaned for 1 minute following all other procedures. An additional three products were included in the evaluation at 20% dilutions.

Results: The 20% solution at 30 seconds were still ineffective on the grinding fluid. However, the increased cleaning time (1 minute) improved the results with two of the products removing over 90% of the contaminant. The table lists the amount of soil added, the amount remaining and the efficiency for each coupon cleaned at both time lengths.

Brulin Corporation	Aquavantage 1400	20	67.85	<input type="checkbox"/>	

Conclusion:

The increased concentration and time both proved effective on the grinding fluid.
