

# CLEANING LABORATORY EVALUATION SUMMARY

SCL #: 2003  
DateRun: 09/16/2003  
Experimenters: Jason Marshall  
ClientType: Tool Manufacturer  
ProjectNumber: Project #1  
Substrates: Steel  
PartType: Coupon  
Contaminants: Coatings  
Cleaning Methods: Immersion/Soak  
Analytical Methods: Gravimetric

Purpose: To retest four products utilizing longer cleaning time

Experimental Procedure: Three products were used at full strength and one product (Oakite Products) was used at 10%, diluted with DI water. Five products were used at room temperature. Cleaning took place in 250 ml beakers with no agitation. The process utilized no water rinse and only used compressed air to dry/rinse the parts. Twelve preweighed steel coupons were coated with Rochester Midland Corp RI 780 (8052-41-3, 95-63-6) using a hand held swab. The coating then heated with a Master Appliance Heat gun at 300 F for 10 minutes. After cooling to room temperature, a second weighing was performed to determine the amount of soil that was added. Three coupons were cleaned in each solution for 10 minutes with no agitation. After drying with the air blow off, coupons were weighed a final time to determine the cleaning efficiencies of each product.

Results: All four products removed over 90% of the coating with an increase in cleaning time. Three of the four removed over 96%. Only AW Chesterton had no improvement with the additional cleaning time. The table below lists the amount of soil added and the amount remaining after cleaning for each coupon cleaned.
